Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete each of the following questions, demonstrating your understanding of the concepts discussed in the lecture)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

a. a section of a chromosome is inserted

b. a piece of a chromosome is deleted

c. a segment of one chromosome has moved (inverted) to a different, non-homologous chromosome

d. a section of a chromosome appears to be on one chromosome but is not

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in 2ⁿ where n is total number chromosomes pairs, in this case with four chromosomes pairs we have 2⁴ which is 16 or 16² genetically different gametes

3. Although your offspring is a combination of both of your genes, you recognize that some traits come from one independent chromosome. For example, both of your eyes are blue, but your nose and hair are inherited together?

That's because linked genes are found on the same chromosome. Traits that are independent assortment are not, and a heterozygous-diploid only passes either homologous chromosome down with all the genes on that chromosome or the other chromosome, which will be inherited together.

4. Describe the alignment of chromosomes during prophase I, write the equations:

Homologous chromosomes I chromosomes carry just homologous chromosomes along together, called bivalents. This is a synaptonemal complex to allow the crossing over to occur and results in two linked chromosomes.

5. How does recombination lead to chromosomes with recombinant alleles? Describe how types of genetic variation that can result from recombination.
