

Each individual genotype in a population leading to a particular gene, using the Hardy-Weinberg principle - (1)

- In a population of randomly mating individuals:

• Genotype frequencies remain constant from one generation to the next (assuming no selection, migration, mutation, or genetic drift)

- Allele frequencies remain constant from one generation to the next (assuming no selection, migration, mutation, or genetic drift)

• Genotype frequencies can be predicted from allele frequencies

- Allele frequencies can be predicted from genotype frequencies

• Genotype frequencies can be predicted from allele frequencies (assuming random mating)

- The genotype frequencies of the offspring generation depend on the parents' genotype

• Genotype frequencies of the offspring generation

- They depend on the genotype frequencies of the parents (not on the allele frequencies)
- The frequency of AA is equal to the square of the frequency of A in the gene pool
- The frequency of Aa is equal to $2 \times$ the frequency of A in the gene pool \times the frequency of a in the gene pool
- In the case of 2 alleles A and a , the genotype frequencies are p^2 , $2pq$, and q^2 for AA , Aa , and aa respectively
- The frequency of AA is p^2
- The frequency of Aa is $2pq$
- The frequency of aa is q^2
- Genotype frequencies of the offspring generation depend on the allele frequencies of the parents (not on the genotype frequencies of the parents)
- Genotype frequencies of the offspring generation depend on the allele frequencies of the parents (not on the genotype frequencies of the parents)
- Genotype frequencies of the offspring generation depend on the allele frequencies of the parents (not on the genotype frequencies of the parents)
