

Function description

On trucks with trailing axle and axle weight limiter, the axle weight limiter prevents the drive axle weight from exceeding the legally permitted value when the trailing axle is lifted.

The axle weight limiter senses the depression of the rear suspension via levers which activate a transmitter. The transmitter powers the trailing axle hoist to lower the axle when the weight on the drive axle exceeds the permitted value.

The axle weight limiter has an integrated delay of 20 seconds before the axle is lowered. This is to prevent suspension movements when driving on uneven surfaces, e.g. bumps, to affect the axle weight limiter.

The axle weight limiter is located on a cross member of the frame and consists of:

- Lever
- Bell crank
- Return spring
- Transmitter
- Bracket
- Control unit (located in cab)
- Cable harness

The tripping point, i.e. the distance between lever and adjusting screw, must be set correctly to enable the axle weight limiter to lower the trailing axle at maximum permitted weight.

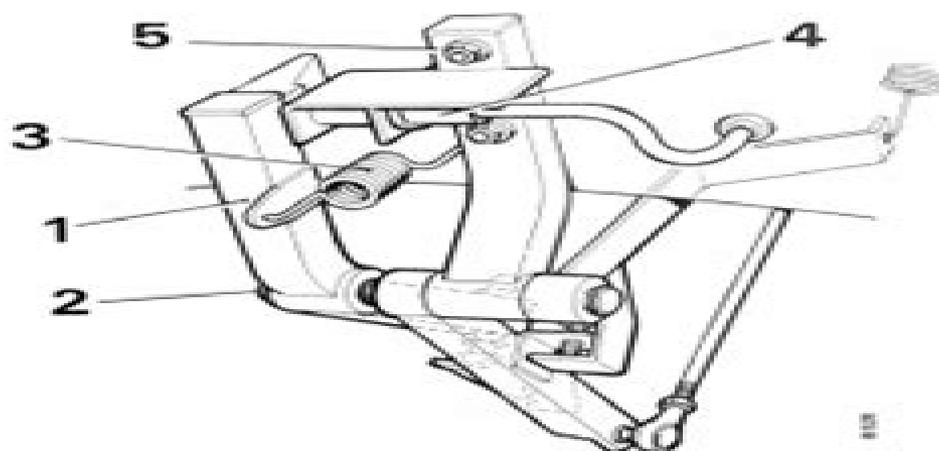

This distance, B, depends on bogie weight and type of springs fitted.

The following tables state the distance B for different spring types at certain bogie weights. The tripping points given are for axle weights of 9.7, 10.7 and 11.7 tonnes.

Note! Applies for lowered trailing axle.

The values in the tables are theoretical, which means that the tripping point may vary ± 300 kg.

To arrive at the correct tripping point, the drive axle must first be loaded to maximum axle weight. The distance B is then adjusted with the adjusting screw to set the tripping point in this position.

1. Lever
2. Bell crank
3. Return spring
4. Transmitter
5. Bracket
