

Biologists stocked a lake with 400 trout and estimated the carrying capacity to be 10,000. Observation of the trout in the lake revealed that the number of trout tripled in the first year.

1. Assuming that the size of the trout population satisfies a logistic model, write the differential equation for the model and an expression for the size of the trout population, P , after t years. Use your expression and the information given to find the value of the constant k .
2. What will be the trout population when the rate of growth predicted by the model changes from increasing to decreasing?
3. Find the value of the largest rate of growth for the trout population. Show your work.
4. After how many year will the rate of growth for the trout population change from increasing to decreasing? Show all your work.
5. Find $\lim_{t \rightarrow \infty} P(t)$.
6. Set up an equation to find when the trout population will reach 8,000. Use your calculator to solve your equation.
