

INTRODUCTION: Evidence has been found to indicate that living things have changed gradually during their natural history. The study of fossils as well as embryology, biochemistry, and comparative anatomy provides evidence for evolution.

OBJECTIVE: In this lab activity you will learn about homologous, analogous, vestigial structures, fossils, embryology and biochemistry and their significance in evolution theory.

MATERIALS: Map Pencils

PROCEDURES:

I. COMPARATIVE ANATOMY

HOMOLOGOUS STRUCTURES

- Carefully examine the drawings of the bones. Look for *similarities* among the various animals.
 - COLOR** each part of the human arm a different color. (All bones of the wrist should be the same color, the bone groups of the hand should be a different single color.) Then **color** the corresponding bone in each of the other animals the same color as the human bone.
 - In Table 1 (question #2 on the *Answer Sheet* describe the **function** of each set of bones and answer the question.)

ANALOGOUS STRUCTURES

- Examine the butterfly wing and the bird wing. Answer questions 4 - 6 on the answer sheet.

VESTIGIAL STRUCTURES

Gradual changes have occurred through time that have in some cases reduced or removed the function of some body structures and organs. The *penguin's wings* and the *leg bones of snakes* are examples of this phenomenon.

- The cave fish and minnow are related, but the cave fish is blind. Answer questions 7-8 on the answer sheet.

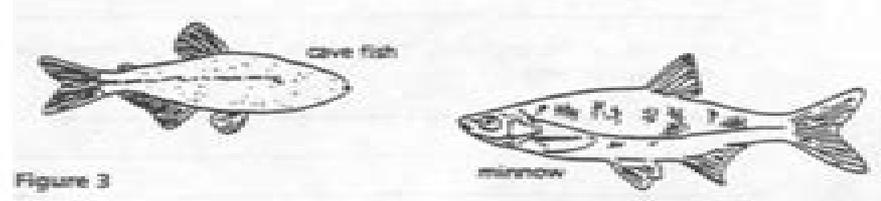

Figure 3

- Read the list of *human vestigial* structures in Table 2 (question #9). Suggest a *possible function* for each structure and explain *why* it became vestigial. Then complete questions 10 -12
