Hotel HVAC Design Guide Charles Nehme, Hotels rely on efficient HVAC systems to ensure the comfort of their guests HVAC Heating Ventilation and Air Conditioning systems are used to control the temperature humidity and air quality of a hotel s interior environment By regulating a hotel s indoor environment HVAC systems help to create a more comfortable and healthy atmosphere for guests Hotels typically use a combination of heating and cooling systems to maintain the desired temperature in each room Heating systems like furnaces boilers and heat pumps are used to warm the air during colder months while cooling systems like air conditioners and

evaporative coolers are used to cool the air in warmer months In addition ventilation systems are used to bring in fresh outdoor air and filter out airborne pollutants HVAC systems in hotels must be designed and maintained to meet the specific needs of the hotel Factors such as the size of the hotel the number of rooms and the climate of the local area all need to be taken into account when designing an HVAC system It is also important to ensure that the HVAC system is energy efficient as this can help reduce both energy costs and the hotel s environmental impact Hotels also rely on HVAC systems to filter out airborne pollutants such as dust pollen and other allergens Air filters and purifiers help to clean the air of these particles helping to reduce the risk of guests developing allergies or other respiratory illnesses Finally the HVAC system in a hotel plays an important role in controlling humidity levels Low humidity levels can cause guests to feel uncomfortable or even sick while high humidity levels can lead to mold and mildew growth By regulating humidity levels HVAC systems help to create a more comfortable and healthy environment for guests

HVAC Guide to Air Handling System Design A. Bhatia, 2014-11-01 The term Air Handling System refers to the equipment where air is conditioned to an acceptable level for distribution within the building An air handling unit often abbreviated as AHU is a very important component of central air conditioning system It is responsible for drawing return air from the indoor spaces mixing it with outdoor air conditioning it to the acceptable level for distribution within the building The modular packaged equipment offered by various manufacturers is pretty standard HVAC designers can simply spec the performance requirements and pick and choose from a wide array of standard building blocks to assemble a unit that meets their specific project needs But large majority of air handlers are custom built or tailor made demanding HVAC designer to apply fundamental psychrometrics processes to precisely estimate the capacity and airflow requirements select the fan coil and other auxiliaries and integrate these properly to the building control system This 6 hr Quick Book outlines the key design considerations for sizing selecting and estimating the capacity and airflow rate of air handling systems At the conclusion of this quick book the reader will be able to answer What is function of Air handling unit and what factors affect its sizing How are air conditioning processes depicted on the psychrometric chart What is difference between room sensible and grand sensible heat factor How is airflow rate and the
