Build Your Own Low-Power Transmitters Rudolf F. Graf, William Sheets, 2001-08-03 This comprehensive book addresses applications for hobbyist broadcasting of AM SSB TV FM Stereo and NBFM VHF UHF signals with equipment readers can build themselves for thousands of dollars less than similar equipment sold on the retail market The authors fully explore the legal limits and ramifications of using the equipment as well as how to get the best performance for optimum range The key advantage is referencing a low cost source for all needed parts including the printed circuit board as well as the kit Complete source information has been included to help each reader find the kits and parts they need to build these fascinating projects

BOOK JACKET The Design and Implementation of Low-Power CMOS Radio Receivers Derek Shaeffer, Thomas H Lee, 2013-03-21 It is hardly a profound observation to note that we remain in the midst of a wireless revolution In 1998 alone over 150 million cell phones were sold worldwide representing an astonishing 50% increase over the previous year Maintaining such a remarkable growth rate requires constant innovation to decrease cost while increasing performance and functionality Traditionally wireless products have depended on a mixture of semicond tor technologies spanning GaAs bipolar and BiCMOS just to name a few A question that has been hotly debated is whether CMOS could ever be suitable for RF applications However given the acknowledged inferiority of CMOS transistors relative to those in other candidate technologies it has been argued by many that CMOS RF is an oxymoron an endeavor best left cloistered in the ivory towers of academia In rebuttal there are several compelling reasons to consider CMOS for wi less applications Aside from the exponential device and density improvements delivered regularly by Moore s law only CMOS offers a technology path for integrating RF and digital elements potentially leading to exceptionally c pact and low cost devices To enable this achievement several thorny issues need to be resolved Among these are the problem of poor passive

comments broadband noise in MOSFETs and phase noise in oscillators made with CMOS Beyond the component level there is also the important question of whether there are different architectural choices that one would make if CMOS were used given the different constraints

Wireless communications has been advancing rapidly in the past two decades Many high performance systems have been developed such as cellular systems AMPS GSM TDMA CDMA W CDMA etc GPS system global positioning system and WLAN wireless local area network systems The rapid growth of VLSI technology in both digital circuits and analog circuits provides benefits for wireless communication systems Twenty years ago not many people could imagine millions of transistors in a single chip or a complete radio for size of a penny Now not only complete radios have been put in a single chip but also more and more functions have been realized by a single chip and at a much lower price A radio transmits and receives electromagnetic signals through the air The signals are usually transmitted on high frequency carriers For example a typical voice signal requires only 30 Kilohertz bandwidth When it is transmitted by a FM radio station it is often carried by a frequency in the range of tens of megahertz to hundreds of megahertz Usually a radio is categorized by its carrier frequency such as 900 MHz radio or 5 GHz radio In general the higher the carrier frequency the better the directivity but the more difficult the

radio design **Linear Integrated Circuits (Field Effect RF Amplifier/Mixer Integrated Circuits).** ,1969 An integrated MOS RF amplifier mixer circuit capable of receiving FM signals in the 30 to 76 megahertz frequency range was developed successfully The front end IC essentially met or surpassed contract specifications on sensitivity power gain desensitization and spurious response The performance of the integrated circuit compared favorably to results obtained from circuits using discrete devices The circuit which consists of seven p channel MOS enhancement devices fabricated on a common substrate uses MOS dual gate devices in both the direct coupled RF amplifier and mixer stages The MOS transistors necessary to bias these stages are included on the 30 by 40 mil pellet The RF amplifier mixer IC was evaluated in a typical military FM receiver at 30 and 76 megahertz The circuit exhibited an excellent sensitivity of 0.35 and 0.4 of a hard microvolt at 30 and 76 megahertz respectively for a 10 dB signal plus noise to noise ratio at the audio output Power gain and dissipation was 34.0 dB and approximately 100 milliwatts respectively for a 9 volt supply at both 30 and 76 megahertz Desensitization results were very good with interfering signal levels removed by 10 percent from the desired channel frequency of at least 122 dB above the reference level required to degrade the 10 dB signal plus noise to noise ratio to 6 dB The integrated RF amplifier mixer was operated in a varactor tuned assembly and performed well over the 63 to 76 megahertz band **Analysis of the FM Receiver with Frequency Feedback** F.
