Business Analytics for Supply Chains and Operations Wolfgang Garn,2026-04-01 All businesses face continuous pressure to improve efficiency reduce costs and enhance profitability By adopting an analytical approach managers and business owners can identify opportunities and solutions that may not be immediately apparent This book demonstrates how such an approach can be applied systematically to address complex operational challenges Business Analytics for Supply Chains and Operations introduces a range of key topics that are grouped into three areas modelling optimisation and probability The optimisation component includes methods such as linear and integer programming and network flows which are used to address logistics problems e g transportation in supply chains and production strategies in operations The probabilistic component covers queueing systems and inventory models providing tools to analyse uncertainty in operational settings The book aims to enable readers to increase the efficiency and productivity of business operations This requires analysts to observe and define challenges concisely precisely and logically Familiarity with both classical and state of the art operational research techniques and tools is essential for approaching such challenges effectively These tools allow analysts to devise solutions algorithms and methods that provide a competitive advantage Finally results must be communicated clearly to support management decision making This book guides the reader through this process using numerous examples and well worked solutions The book is designed for postgraduate and advanced undergraduate students on business degrees as well as for practising managers seeking analytical tools for decision making It emphasises hands on learning with three main computational tools Excel the primary tool introduced in depth the MathProg modelling language for optimisation and SimPy with Python and a brief introduction to Simio for simulation experiments Online support materials include PowerPoint slides a test bank computer lab sheets with solutions and links to video tutorials Management Science ,2000-09 Issues for Feb 1965 Aug 1967 include Bulletin of the Institute of Management Sciences **Strategic allocation of resources using linear programming model with parametric analysis: in MATLAB and Excel Solver** Dinesh Gupta,2014-05-01 Since the late 1940s linear programming models have been used for many different purposes Airline companies apply these models to optimize their use of planes and staff NASA has been using them for years to optimize their use of limited resources Oil companies use them to optimize their refinery operations Small and medium sized businesses use linear programming to solve a huge variety of problems often involving resource allocation In my study a typical product mix problem in a manufacturing system producing two products each product consists of two sub assemblies is solved for ist optimal solution

through the use of the latest versions of MATLAB having the command simlp which is very much like linprog As analysts we try to find a good enough solution for the decision maker to make a final decision Our attempt is to give the mathematical description of the product mix optimization problem and bring the problem into a form ready to call MATLAB s simlp command The objective of this study is to find the best product mix that maximizes profit The graph obtained using MATLAB commands give the shaded area enclosed by the constraints called the feasible region which is the set of points satisfying all the constraints To find the optimal solution we look at the lines of equal profit to find the corner of the feasible region which yield the highest profit This corner can be found out at the farthest line of equal profit which still touches the feasible region The most critical part is the sensitivity analysis using Excel Solver and Parametric Analysis using computer software which allows us to study the effect on optimal solution due to discrete and continuous change in parameters of the LP model including to identify bottlenecks We have examined other options like product outsourcing one time cost cross training of one operator manufacturing of hypothetical third product on under utilized machines and optimal sequencing of jobs on machines

Department of Operations Research,Frederick S. Hillier,1969 The report presents and evaluates some new heuristic procedures for seeking an approximate solution of pure integer linear programming problems having only inequality constraints The computation time required by these methods after obtaining the optimal noninteger solution by the simplex method has generally been only a small fraction of that used by the simplex method for the problems tested which have 15 to 300 original variables Furthermore the solution obtained by the better procedures consistently has been close to optimal and frequently has actually been optimal There are numerous important problems in logistics that can be formulated as integer linear programming problems These algorithms enable one to obtain good solutions to large problems of this kind Author
