Modern Financial Engineering: Counterparty, Credit, Portfolio And Systemic Risks Giuseppe Orlando, Michele Bufalo, Henry Penikas, Concetta Zurlo, 2021-12-28

The book offers an overview of credit risk modeling and management A three step approach is adopted with the contents after introducing the essential concepts of both mathematics and finance Initially the focus is on the modeling of credit risk parameters mainly at the level of individual debtor and transaction after which the book delves into counterparty credit risk thus providing the link between credit and market risks The second part is aimed at the portfolio level when multiple loans are pooled and default correlation becomes an important factor to consider and model In this respect the book explains how copulas help in modeling The final stage is the macro perspective when the combination of credit risks related to financial institutions produces systemic risk and affects overall financial stability The entire approach is two dimensional as well First all modeling steps have replicable programming codes both in R and Matlab In this way the reader can experience the impact of changing the default probabilities of a given borrower or the weights of a sector Second at each stage the book discusses the regulatory environment This is because at times regulation can have stricter constraints than the outcome of internal models In summary the book guides the reader in modeling and managing credit risk by providing both the theoretical framework and the empirical tools necessary for a modern finance professional In this sense the book is aimed at a wide audience in all fields of study from quants who want to engage in finance to economists who want to learn about coding and modern financial engineering

Risk, 2002 **Saddlepoint Approximation Methods in Financial Engineering** Yue Kuen Kwok, Wendong Zheng, 2018-02-16 This book summarizes recent advances in applying saddlepoint approximation methods to financial engineering It addresses pricing exotic financial derivatives and calculating risk contributions to Value at Risk and Expected Shortfall in credit portfolios under various default correlation models These standard problems involve the computation of tail probabilities and tail expectations of the corresponding underlying state variables The text offers in a single source most of the saddlepoint approximation results in financial engineering with different sets of ready to use approximation formulas Much of this material may otherwise only be found in original research publications The exposition and style are made rigorous by providing formal proofs of most of the results Starting with a

presentation of the derivation of a variety of saddlepoint approximation formulas in different contexts this book will help new researchers to learn the fine technicalities of the topic It will also be valuable to quantitative analysts in financial institutions who strive for effective valuation of prices of exotic financial derivatives and risk positions of portfolios of risky instruments
