Gabion Wall Design Guide:

Biotechnical and Soil Bioengineering Slope Stabilization Donald H. Gray, Robbin B. Sotir, 1996-08-23 The first comprehensive practical guide to the selection, construction and installation of soil bioengineering and biotechnical slope protection. Here is the ultimate guide to physically attractive, environmentally compatible and cost-effective methods of protecting slopes from erosion and mass wasting. Lavishly illustrated with more than 150 photographs and supplemented with scores of charts and tables, this book covers the entire subject from general principles and background on the nature of soil erosion and mass movement to detailed information on root strength, treatment selection, unit costs, critical tractive stresses, methods for harvesting and handling live cuttings, and more. Four illustrated case studies, each addressing a different set of problems and solutions, demonstrate both the application of particular technologies and the site investigation, planning, scheduling, and organization required to complete these projects successfully. This unique reference handbook reviews the horticultural and engineering underpinnings for biotechnical and soil engineering treatments. Documents and explains the role of woody plants in stabilizing slopes against both surficial erosion and mass movement. Provides details on a broad range of soil bioengineering methods including live staking, live fascines, brush layering, live crib walls, branch packing, and live slope gratings. Describes various biotechnical methods and materials including the incorporation of vegetation in erosion control blankets, flexible mats, cellular revetments, geocells, rock armor, riprap, and gabion and open front crib walls. Summarizes the findings of the National Science Foundation sponsored workshop to assess the state of the art and determine research needs. For practicing professionals, researchers, and students in geotechnical engineering, geology, soil science, forestry, and forest engineering, landscape architecture, environmental horticulture, and restoration ecology, this book offers thorough up-to-date coverage that is not available from any other single source.

Highways, a Guide to Their Design and Re-design Lester Abbey, 1989

Cost-effective and Sustainable Road Slope Stabilization and Erosion Control Laura Fay, Michelle Akin, Xianming Shi, National Cooperative Highway Research Program, 2012. In the United States, it is estimated that 75 percent of all roads are low volume roads maintained by some 35,000 local agencies. Low volume roads often omit surface slope protection, and this can lead to slope failure, erosion, and maintenance, safety, and ecological issues. This report presents information on cost-effective and sustainable road slope stabilization techniques with a focus on shallow or near surface slope stabilization and related erosion control methods used on low volume roads. To fully address this topic, planning and site investigation are discussed, as well as erosion control techniques, soil bioengineering, and biotechnical techniques, mechanical stabilization, and earthwork techniques. Information presented in this report was obtained through an extensive literature review and from survey and interview responses. From the survey responses, 30 individuals were interviewed based on the information they made available in the survey. A total of 25 interviews were conducted over the phone, and in two cases, written responses were received.
