

# Eukaryotic gene expression is regulated at many stages

- all organisms must regulate which genes are expressed at any given time
- in the same organism – the genomes are identical from cell to cell
- so why do different cells express different genes/proteins??
- differences result from **differential gene expression** = the expression of different genes by cells with the same genome
- several steps along the replication/transcription/translation path are control points for differential gene expression
  - control of DNA transcription – modification of DNA-histone interaction
  - post-transcriptional control
  - post-translational control
