Multimodal Retinal Imaging:

Microperimetry and Multimodal Retinal Imaging Edoardo Midena, 2013-12-12 Microperimetry allows precise functional examination of the retina and optic nerve and is especially valuable for evaluation of the macular area This fully up to date textbook on microperimetry written by leading experts in the field will also serve as an atlas and diagnostic reference It is designed for use by both ophthalmologists and optometrists in daily clinical practice and clinical research and the contents thus range from basic technical information to the most advanced clinical applications Past and current microperimetry techniques are reviewed and the role of microperimetry in the context of multimodal imaging scenario is explained The full range of clinical applications is then discussed including age related macular degeneration diabetes myopia retinal dystrophies disorders of the vitreoretinal interface inflammatory chorioretinal diseases toxic retinopathies glaucoma and low vision Multimodal Retinal Imaging Amresh Chopdar, Tin Aung, 2014-08-22 span style font size xx small Retinal imaging techniques are used to diagnose and screen for various conditions such as macular degeneration and glaucoma Equally importantly they are used to monitor the progression of previously diagnosed conditions **A Guide to Multimodal Retinal Imaging** Spencer, 2026-07-14 *Multimodal Retinal Imaging* Philip A. Legg, 2010 **Multimodal Retinal Imaging Via OCT Multi-volume Averaging and Two Photon Excited Fluorescence** William Newberry, 2022 Advancements in optical imaging are needed to study vision robbing diseases New technology can be developed using animal models which can progress the understanding of both retinal function and that of novel imaging methods Fluorescence is a convenient source of contrast in the retina due to the relative ease of introducing extrinsic fluorophores as well as its various opportunities for autofluorescence two photon excited fluorescence TPEF is a suitable modality of this but its need for high incident powers arises concerns of damaging the retina A pulsed laser coupled with high numerical aperture and adaptive optics aids to lower the required power but sample motion remains an issue In this thesis I present on improvements made to a TPEF imaging system as well as an algorithm that utilizes co acquired optical coherence tomography OCT to aid in motion correction **Deep Learning Based Multimodal Retinal Image Processing** Yiqian Wang, 2022 The retina the light sensitive tissue lining the interior of the eye is the only part of the central nervous system CNS that can be imaged at micron resolution in vivo Retinal diseases including age related macular degeneration diabetes retinopathy and vascular occlusions are important causes of vision loss and have systemic implications for millions of patients Retinal imaging is of great significance to diagnosing and monitoring both retinal diseases and systematic diseases that manifest in the retina A variety of imaging devices have been developed including color fundus CF photography infrared reflectance IR fundus autofluorescence FAF dye based angiography optical coherence tomography OCT and OCT angiography OCT A Each imaging modality is particularly useful for observing certain aspects of the retina and can be utilized for visualization of specific diseases In this dissertation we propose deep learning based methods for retinal image processing including multimodal

retinal image registration OCT motion correction and OCT retinal layer segmentation We present our established work on a deep learning framework for multimodal retinal image registration a comprehensive study of the correlation between subjective and objective evaluation metrics for multimodal retinal image registration convolutional neural networks for correction of axial and coronal motion artifacts in 3D OCT volumes and joint motion correction and 3D OCT layer segmentation network The dissertation not only proposes novel approaches in image processing enhances the observation of retinal diseases but will also provide insights on observing systematic diseases through the retina including diabetes cardiovascular disease and preclinical Alzheimer s Disease The proposed deep learning based retinal image processing approaches would build a connection between ophthalmology and image processing literature and the findings may provide a good insight for researchers who investigate retinal image registration retinal image segmentation and retinal disease detection

Emerging Imaging Technologies in Medicine Mark A. Anastasio,Patrick La Riviere,2012-12-06 From the discovery of x rays in 1895 through the emergence of computed tomography CT in the 1970s and magnetic resonance imaging MRI in the 1980s non invasive imaging has revolutionized the practice of medicine While these technologies have thoroughly penetrated clinical practice scientists

continue to develop novel approaches that promise to push imaging into entirely new clinical realms while addressing the issues of dose sensitivity or specificity that limit existing imaging approaches Emerging Imaging Technologies in Medicine surveys a number of emerging technologies that have the promise to find routine clinical use in the near less than five years mid five to ten years and long term more than ten years time frames Each chapter provides a detailed discussion of the associated physics and technology and addresses improvements in terms of dose sensitivity and specificity which are limitations of current imaging approaches In particular the book focuses on modalities with clinical potential rather than those likely to have an impact mainly in preclinical animal imaging The last ten years have been a period of fervent creativity and progress in imaging technology with improvements in computational power nanofabrication and laser and detector technology leading to major new developments in phase contrast imaging photoacoustic imaging and optical imaging
