

Concepts: Patterns in Triangles

Many more mathematical relationships are produced by the placement of lines across the two equilateral sides with vertices placed at different rational points on the given side than are produced by triangles.

Students are asked to draw lines to create two or three triangles. These lines are drawn across the two sides from a common point and vertices opposite each other respectively. Students should be encouraged to draw a variety of lines from a common point on the two equilateral sides. The main idea here is to draw all triangles and patterns that students produce and questions should be asked about the patterns of triangles that are produced when lines are drawn across the two sides.

- 1) A horizontal line is drawn across the triangle and a horizontal line is drawn across the triangle from a point on the left side. What are all the triangles produced and what are the relationships between the triangles? Describe the triangles and the relationships.

a. What are the triangles that are produced?

b. What are the relationships between them?

c. What happens if the horizontal line is drawn from a point on the right side?
