The system of linear equations is covered next followed by a chapter on the interpolation by Lagrange polynomial. The next sections look at interpolation and curve fitting, nonlinear equations, numerical differentiation, integration, ordinary differential equations and optimization. Numerous methods such as the Simpson, Euler, Heun, Runge-Kutta, Golden Search, Nelder-Mead and more are all covered in those chapters. The eighth chapter provides readers with matrices and Eigenvalues and Eigenvectors. The book finishes with a complete overview of differential equations. Provides examples and problems of solving electronic circuits and neural networks. Includes new sections on adaptive filters, recursive least squares estimation, Bairstow's method for a polynomial equation and more. Explains Mixed Integer Linear Programming (MILP) and DOA (Direction of Arrival) estimation with eigenvectors. Aimed at students who do not like and/or do not have time to derive and prove mathematical results.
