

Luenberger Chapter 3 exercise 7 (p 68) asks for an algebraic proof:

Let A be an $m \times n$ matrix and \mathbf{c} be an n -vector. Prove that $A\mathbf{x} \leq \mathbf{0}$ implies $\mathbf{c}'\mathbf{x} \leq 0$ if and only if $\mathbf{c}' = \mathbf{y}'A$ for some $\mathbf{y} \geq \mathbf{0}$.

Consider this example.

(a) Show that

$$\begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & -1 \end{bmatrix} \mathbf{x} \leq \mathbf{0} \Rightarrow [3 \ 1 \ -1] \mathbf{x} \leq 0$$

$$\text{because } [3 \ 1 \ -1] = [1 \ 1] \begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & -1 \end{bmatrix}.$$

(b) On the other hand,

$$\begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & -1 \end{bmatrix} \mathbf{x} \leq \mathbf{0} \not\Rightarrow [2 \ 1 \ -1] \mathbf{x} \leq 0$$

$$\text{because } [2 \ 1 \ -1] \neq [y_1 \ y_2] \begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & -1 \end{bmatrix}.$$

For example,

$$\begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & -1 \end{bmatrix} \begin{bmatrix} -1 \\ 1 \\ -2 \end{bmatrix} \leq \mathbf{0} \text{ but } [2 \ 1 \ -1] \begin{bmatrix} -1 \\ 1 \\ -2 \end{bmatrix} = 1.$$

Find another vector $\mathbf{c}' \neq \mathbf{y}'A$ for any $\mathbf{y} \geq \mathbf{0}$ and show a vector \mathbf{x} such that $A\mathbf{x} \leq \mathbf{0}$ and $\mathbf{c}'\mathbf{x} \not\leq 0$.

(c) Now prove the **general** result as requested by Luenberger. You may find linear programming duality useful.

H-infinity Control and Estimation of State-multiplicative Linear Systems Eli Gershon, Uri Shaked, Isaac Yaesh, 2005-06-24
Multiplicative noise appears in systems where the process or measurement noise levels depend on the system state vector. Such systems are relevant for example in radar measurements where larger ranges involve higher noise level. This monograph embodies a comprehensive survey of the relevant literature with basic problems being formulated and solved by applying various techniques including game theory, linear matrix inequalities and Lyapunov parameter dependent functions. Topics covered include convex H_2 and H_∞ norms analysis of systems with multiplicative noise, state feedback control and state estimation of systems with multiplicative noise, dynamic and static output feedback of stochastic bilinear systems, tracking controllers for stochastic bilinear systems utilizing preview information. Various examples which demonstrate the applicability of the theory to practical control engineering problems are considered, two such examples are taken from the aerospace and guidance control areas.

Computational Methods in Optimal Control Problems I.H. Mufti, 2012-12-06
The purpose of this modest report is to present in a simplified manner some of the computational methods that have been developed in the last ten years for the solution of optimal control problems. Only those methods that are based on the minimum maximum principle of Pontryagin are discussed here. The outline of the report is as follows: In the first two sections a control problem of Bolza is formulated and the necessary conditions in the form of the minimum principle are given. The method of steepest descent and a conjugate gradient method are discussed in Section 3. In the remaining sections the successive sweep method, the Newton Raphson method and the generalized Newton Raphson method, also called quasilinearization method, are presented from a unified approach which is based on the application of Newton Raphson approximation to the necessary conditions of optimality. The second variation method and other shooting methods based on minimizing an error function are also considered.

Introduction to Modern Economic Growth Daron Acemoglu, 2008-12-15
From Nobel Prize winning economist Daron Acemoglu, an incisive introduction to economic growth. *Introduction to Modern Economic Growth* is a groundbreaking text from one of today's leading economists. Daron Acemoglu gives graduate students not only the tools to analyze growth and related macroeconomic problems but also the broad perspective needed to apply those tools to the big picture questions of growth and divergence. And he introduces the economic and mathematical foundations of modern growth theory and macroeconomics in a rigorous but easy to follow manner. After covering the necessary background on dynamic general equilibrium and dynamic optimization, the book presents the basic workhorse models of growth and takes students to the

frontier areas of growth theory including models of human capital endogenous technological change technology transfer international trade economic development and political economy The book integrates these theories with data and shows how theoretical approaches can lead to better perspectives on the fundamental causes of economic growth and the wealth of nations Innovative and authoritative this book is likely to shape how economic growth is taught and learned for years to come Introduces all the foundations for understanding economic growth and dynamic macroeconomic analysis Focuses on the big picture questions of economic growth Provides mathematical foundations Presents dynamic general equilibrium Covers models such as basic Solow neoclassical growth and overlapping generations as well as models of endogenous technology and international linkages Addresses frontier research areas such as international linkages international trade political economy and economic development and structural change An accompanying Student Solutions Manual containing the answers to selected exercises is available 978 0 691 14163 3 24 95 See <https://press.princeton.edu/titles/8970.html> For Professors only To access a complete solutions manual online email us at acemoglusolutions@press.princeton.edu

Formulating Principal-Agent Service Contracts for a Revenue Generating Unit Shuo Zeng, Moshe Dror, 2015-07-02 This book examines contractual options for a performance based contract between an owner of a revenue generating unit and a repair agent for such unit The framework of the analysis is that of economists principal agent problem The contractual options of a principal and an agent are modeled as a Markov process with an undetermined time horizon For a risk neutral principal the authors identify the conditions under which a principal contracts with a risk neutral risk averse or risk seeking agent and derive the principal's optimal offer together with the agent's optimal service capacity response In essence the book provides an extensive formulating analysis of principal agent contracts given any exogenous parameter values

Ultimately a small number of formulas cover a large spectrum of principal agent conditions **Optimal Portfolios** Ralf Korn, 1997 The focus of the book is the construction of optimal investment strategies in a security market model where the prices follow diffusion processes It begins by presenting the complete Black Scholes type model and then moves on to incomplete models and models including constraints and transaction costs The models and methods presented will include the stochastic control method of Merton the martingale method of Cox Huang and Karatzas et al the log optimal method of Cover and Jamshidian the value preserving model of Hellwig etc Stress is laid on rigorous mathematical presentation and clear economic interpretations while technicalities are kept to the minimum The underlying mathematical concepts will be provided No a priori knowledge of stochastic calculus stochastic control or partial differential equations is necessary however some knowledge in stochastics and calculus is needed *Numerical Solution of Systems of Simultaneous*

Polynomial Equations Stanford University. Systems Optimization Laboratory, A. N. Rosenberg, 1983 **An Invitation to Statistics in Wasserstein Space** Victor M. Panaretos, Yoav Zemel, 2020-03-10 This open access book presents the key aspects of statistics in Wasserstein spaces i.e. statistics in the space of probability measures when endowed with the

geometry of optimal transportation Further to reviewing state of the art aspects it also provides an accessible introduction to the fundamentals of this current topic as well as an overview that will serve as an invitation and catalyst for further research

Statistics in Wasserstein spaces represents an emerging topic in mathematical statistics situated at the interface between functional data analysis where the data are functions thus lying in infinite dimensional Hilbert space and non Euclidean statistics where the data satisfy nonlinear constraints thus lying on non Euclidean manifolds The Wasserstein space provides the natural mathematical formalism to describe data collections that are best modeled as random measures on Euclidean space e g images and point processes Such random measures carry the infinite dimensional traits of functional data but are intrinsically nonlinear due to positivity and integrability restrictions Indeed their dominating statistical variation arises through random deformations of an underlying template a theme that is pursued in depth in this monograph
