Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete your work on the following questions, understanding your understanding of the concepts discussed in the lesson)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

(a) a section of a chromosome is inserted

(b) a piece of a chromosome is deleted

(c) a large section of a chromosome has moved (inverted) to a different part of the chromosome

(d) a section of a chromosome appears to be on one chromosome but is on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

Match the number of genetically different gametes that can be produced to each of 2ⁿ where n is total number chromosomes pairs, a diploid cell with four chromosomes pairs can produce gametes of 16 or 32 genetically different gametes

3. Although you will learn a mechanism of mutation that causes gene mutations that cause health issues the less important mechanism (for example, health issues such as sickle cell) may occur that is not inherited together?

That mutation is called together and found on the same chromosome. This mutation may be independent assortment or crossing over and recombination. It may only occur with recombination. Mutations that occur with recombination may be inherited together.

4. Describe the alignment of chromosomes during prophase I, write the equations:

Chromosomes I homologous pairs and homologous chromosomes align together, called synapsis. This is a synapsis because it shows the pairing between sister and homologous chromosomes.

5. How does recombination lead to chromosomes with different alleles? Describe how types of genetic variation that can occur from recombination.

Fairbanks, William Ralph Andersen, 1999 Genetics The Continuity of Life Principles of Evolution Jonathan Bard, 2016-09-23 Principles of Evolution covers all aspects of the subject Following an introductory section that provides necessary background it has chapters on the evidence for evolution that cover the fossil record DNA sequence homologies and protein homologies evo devo It also includes a full history of life from the first universal common ancestor through the rise of the eukaryote and on to the major groups of phyla This section is followed by one on the mechanism of evolution with chapters on variation selection and speciation The main part of the book ends with a chapter on human evolution and this is followed by appendices that expand on the making of fossils the history of the subject and creationism What marks this book as different from others on evolution is its systems biology perspective This new area focuses on the role of protein networks and on multi level complexity and is used in three contexts First most biological activity is driven by such networks and this has direct implications for understanding evo devo and for seeing how variation is initiated mainly during embryogenesis Second it provides the natural language for discussing phylogenetics Third evolutionary change involves events at levels ranging from the genome to the ecosystem and systems biology provides a context for integrating material of this complexity The book assumes a basic grounding in biology but little mathematics as the difficult subject of evolutionary population genetics is mainly covered qualitatively with major results being discussed and used rather than derived Principles of Evolution will be an interesting and thought provoking text for undergraduates and graduates across the biological sciences
