mathematical methods for scientists and engineers It provides a practical pedagogical introduction to utilizing Python in

Mathematical and Computational Methods courses Both analytical and computational examples are integrated from its start

Each chapter concludes with a set of problems designed to help students hone their skills in mathematical techniques

computer programming and numerical analysis The book places less emphasis on mathematical proofs and more emphasis on

how to use computers for both symbolic and numerical calculations It contains 182 extensively documented coding examples

based on topics that students will encounter in their advanced courses in Mechanics Electronics Optics Electromagnetism

Quantum Mechanics etc An introductory chapter gives students a crash course in Python programming and the most often

used libraries SymPy NumPy SciPy Matplotlib This is followed by chapters dedicated to differentiation integration vectors

and multiple integration techniques The next group of chapters covers complex numbers matrices vector analysis and vector

spaces Extensive chapters cover ordinary and partial differential equations followed by chapters on nonlinear systems and on

the analysis of experimental data using linear and nonlinear regression techniques Fourier transforms binomial and Gaussian

distributions The book is accompanied by a dedicated GitHub website which contains all codes from the book in the form of

ready to run Jupyter notebooks A detailed solutions manual is also available for instructors using the textbook in their

courses Key Features A unique teaching approach which merges mathematical methods and the Python programming skills

which physicists and engineering students need in their courses Uses examples and models from physical and engineering

systems to motivate the mathematics being taught Students learn to solve scientific problems in three different ways
