

Gene Expression—Translation

How do cells synthesize polypeptides and convert them to functional proteins?

Why?

The message in your DNA of who you are and how your body works is carried out by cells through gene expression. In most cases this means synthesizing a specific protein to do a specific job. First, mRNA is transcribed from the DNA code. Then, the mRNA sequence is translated into a polypeptide sequence.

 - What do the letters U, C, A, and G in Model 1 represent?
 - What do the abbreviations such as Phe, Ile, Ala, and Gly in Model 1 represent?
 - The language of mRNA is often described as a "triplet code." Explain the significance of this reference.

B. Hershey, Michael B. Mathews, 2000 Since the 1996 publication of *Translational Control* there has been fresh interest in protein synthesis and recognition of the key role of translation control mechanisms in regulating gene expression This new monograph updates and expands the scope of the earlier book but it also takes a fresh look at the field In a new format the first eight chapters provide broad overviews while each of the additional twenty eight has a focus on a research topic of more specific interest The result is a thoroughly up to date account of initiation elongation and termination of translation control mechanisms in development in response to extracellular stimuli and the effects on the translation machinery of virus infection and disease This book is essential reading for students entering the field and an invaluable resource for investigators of gene expression and its control *Bibliography of Agriculture*, 1995 **Bibliography of Agriculture with Subject Index**, 1995

Translational Regulation of Gene Expression J. Ilan, 2013-11-11 **Translation In Eukaryotes** Hans Trachsel, 1991-07-24 This book presents an up to date review of the mechanisms and regulation of translation in eukaryotes

Topics covered include the basic biochemical reactions of translation initiation elongation and termination and the regulation of these reactions under different physiological conditions and in virus infected cells The book belongs on the shelf of everyone interested in translation in eukaryotes including students and researchers requiring comprehensive overviews of most aspects of translation and instructors who want to cover these topics at an advanced level Control of Gene Expression Through Coupling of Transcription and Translation Flint Ruben Stevenson-Jones,2017 **Translation Factors in Control of Gene Expression** ,1997 **Genetics of Translation** Mick F. Ilan,2012-10-24 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in *Translational Regulation of Gene Expression* which was published in 1987 It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein Thus we find that important proteins such as protooncogenes growth factors stress proteins cytokines lymphokines iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription we can state that for these genes at least the expression is translationally controlled Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field The present book describes mechanisms of translational regulation in bacteria yeast and eukaryotic viruses as well as in eukaryotic genes In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume
