The chapters deal with the research on and conceptual analysis of specific arithmetic topics: addition, subtraction, multiplication, division, decimals and fractions, or with overarching themes that pervade the early curriculum and constitute the links with the more advanced topics of mathematics: intuition, number sense and estimation. Serving as a link between the communities of cognitive researchers and mathematics educators, the book capitalizes on the recent research successes of cognitive science and reviews the literature of the math education community as well.

Metacognition in Mathematics Education Annemie Desoete, Marcel Veenman, 2006. For some decades, theoretical and empirical research has focused on the phenomenon of metacognition and its overwhelming importance to human learning and performance. The real growth in theoretical and empirical studies about metacognition started with the work of Flavell at the end of the 1970s in the context of research on metamemory. The metacognitive concept has been very successful, stimulating a lot of studies. The metacognitive research on reading peaked in the 1980s and has levelled since. Metacognition has more recently also been applied to mathematics. Metacognition can be differentiated into two central components: namely, metacognitive knowledge and metacognitive processes or skills. In the same vein, Brown (1978) distinguished metacognitive knowledge about the interaction between person, task, and strategies, characteristics from the regulation of one's own cognitive activities. The purpose of this book is to help to summarise and clarify some of the issues on the conceptualisation, the assessment, and the training of metacognition on mathematical issues in learners with and without mathematics learning disabilities: metacognition in mathematics performance.
