Practical Plane Geometry, with ... notes, exercises, and applications, etc John S. RAWLE,1872 **An Introduction to C*-Algebras and Noncommutative Geometry** Heath Emerson,2024-07-27 This is the first textbook on C algebra theory with a view toward Noncommutative Geometry Moreover it fills a gap in the literature providing a clear and accessible account of the geometric picture of K theory and its relation to the C algebraic picture The text can be used as the basis for a graduate level or a capstone course with the goal being to bring a relative novice up to speed on the basic ideas while offering a glimpse at some of the more advanced topics of the subject Coverage includes C algebra theory K theory K homology Index theory and Connes Noncommutative Riemannian geometry Aimed at graduate level students the book is also a valuable resource for mathematicians who wish to deepen their understanding of noncommutative geometry and algebraic K theory A wide range of important examples are introduced at the beginning of the book There are lots of excellent exercises and any student working through these will benefit significantly Prerequisites include a basic knowledge of algebra analysis and a bit of functional analysis As the book progresses a little more mathematical maturity is required as the text discusses smooth manifolds some differential geometry and elliptic operator theory and K theory The text is largely self contained though occasionally the reader may opt to consult more specialized material to further deepen their understanding of certain details *Geometry - Intuition and Concepts* Jost-Hinrich Eschenburg,2022-10-31 This book deals with the geometry of visual space in all its aspects As in any branch of mathematics the aim is to trace the hidden to the obvious the peculiarity of geometry is that the obvious is sometimes literally before one s eyes Starting from intuition spatial concepts are embedded in the pre existing mathematical framework of linear algebra and calculus The path from visualization to mathematically exact language is itself the learning content of this book This is intended to close an often lamented gap in understanding between descriptive preschool and school geometry and the abstract concepts of linear algebra and calculus At the same time descriptive geometric modes of argumentation are justified because their embedding in the strict mathematical language has been clarified The concepts of geometry are of a very different nature they denote so to speak different layers of geometric thinking some arguments use only concepts such as point straight line and incidence others require angles and distances still others symmetry considerations Each of these conceptual fields determines a separate subfield of geometry and a separate chapter of this book with the exception of the last mentioned conceptual field symmetry which runs through all the others Incidence Projective geometry Parallelism Affine geometry Angle Conformal Geometry Distance Metric Geometry Curvature Differential Geometry Angle as distance measure Spherical and Hyperbolic Geometry Symmetry Mapping Geometry The mathematical experience acquired in the visual space can be easily transferred to much more abstract situations with the help of the vector space notion The generalizations beyond the visual dimension point in two directions Extension of the number concept and transcending the three illustrative dimensions This book is a
