## Identifying DNA as the Genetic Material

**KEY CONCEPT** DNA was identified as the genetic material through a series of experiments.

### MAIN IDEAS

- Griffith finds a “transforming principle.”
- Avery identifies DNA as the transforming principle.
- Hershey and Chase confirm that DNA is the genetic material.

### VOCABULARY

**bacteriophage**, p. 228

### Review

deoxyribonucleic acid (DNA), gene, enzyme

**Connect** Some people think a complicated answer is better than a simple one. If they have a head cold, for instance, they may use all sorts of pills, syrups, and sprays, when they simply need rest, water, and warm chicken soup. In the early 1900s, most scientists thought DNA’s structure was too repetitive for it to be the genetic material. Proteins, which are more variable in structure, appeared to be a better candidate. Starting in the 1920s, experiments provided data that did not support this idea. By the 1950s, sufficient evidence showed that DNA—the same molecule that codes for GFP in the glowing mouse—carries genetic information.

### MAIN IDEA

## Griffith finds a “transforming principle.”

In 1928 the British microbiologist Frederick Griffith was investigating two forms of the bacterium that causes pneumonia. One form is surrounded by a coating made of sugar molecules. Griffith called these bacteria the S form because colonies of them look smooth. The second form of bacteria do not have a smooth coating and are called the R, or rough, form. As you can see in **FIGURE 8.1**, when Griffith injected the two types of bacteria into mice, only the S type killed the mice. When the S bacteria were killed with heat, the mice were unaffected. Therefore, only live S bacteria would cause the mice to die.

### TAKING NOTES

Make a table to keep track of the experiments discussed in this section and how they contributed to our understanding of DNA.

Experiment	Results
Griffith’s mice	A transformable material changed harmless bacteria into disease-causing bacteria.

**FIGURE 8.1** Griffith’s Experiments

The S form of the bacterium is deadly; the R form is not.
