

3.2.3 – arithmetic operations in a programming language

Q1.

The code below shows a Python program that is being developed.

It is supposed to calculate and display the highest common factor of two numbers entered by the user.

The highest common factor of two numbers is the largest number that both numbers can be divided by without leaving a remainder.

Examples:

- the highest common factor of the numbers 6 and 9 is 3
- the highest common factor of 2 and 5 is 1

Line numbers are shown but are not part of the program code.

```
1 num1 = int(input())
2 num2 = int(input())
3 hcf = 1
4 count = 1
5 while count < num1:
6     if (num1 % count == 0 and num2 % count == 0):
7         hcf = count
8         count = count + 1
9     print(hcf)
```

The program works correctly sometimes but not always. When the user enters the numbers 4 and 6 it correctly outputs 2, but when the user enters the numbers 4 and 4 it should output 4 but it does not.

- (a) State the output from the program when the user enters the numbers 4 and 4

(1)

- (b) State the line number from the program which contains the error that stops the program from sometimes working correctly.

(1)

- (c) Describe how the line of code identified in your answer to (b) should be changed so that the program will work correctly.
