

INSTRUMENTATION AND PROCESS CONTROL

Answer Key

1. The process control system is designed to maintain the process variables within the desired range. It does this by comparing the actual process variables with the setpoint and adjusting the control action accordingly.

2. The control action is determined by the controller, which uses a control algorithm to calculate the required control signal. The control signal is then sent to the actuator, which adjusts the process variables.

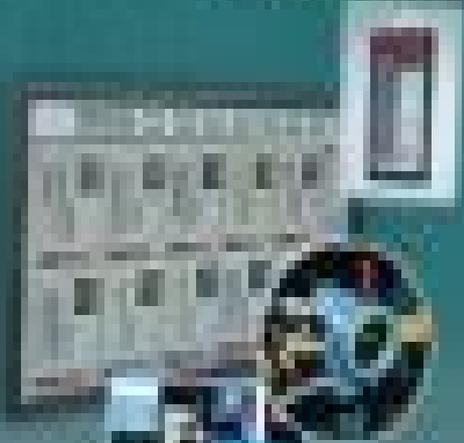

3. The control system is designed to be stable, meaning that it will not oscillate or diverge from the setpoint. This is achieved by using a control algorithm that provides a damping effect on the process.

4. The control system is designed to be robust, meaning that it will be able to handle disturbances and changes in the process. This is achieved by using a control algorithm that is able to adapt to changes in the process.

5. The control system is designed to be efficient, meaning that it will use the minimum amount of control action to maintain the process variables within the desired range. This is achieved by using a control algorithm that is able to optimize the control action.
