

Chapter 4- The Integumentary System

Section 1: Functional Anatomy of the Skin

Integumentary system, or the integument, has two major components.

- **Cutaneous membrane**, or skin, including the epidermis and papillary layer of the dermis.
- **Accessory structures** including the hair, nails, and a variety of exocrine glands.

- Cutaneous Membrane:
 - The Epidermis
 - Dermis
 - Papillary layer
 - Reticular layer
- Hypodermis
- Accessory Structures
- Artery
- Vein
- Cutaneous Plexus

Functions of the Integumentary System:

- Protect underlying tissues and organs against impact abrasion, fluid loss, and chemical attack
- Excrete salt, water, and organic wastes by integumentary glands
- Maintain normal body temperature through either insulation or evaporative cooling, as needed
- Produces Melanin, which protects underlying tissues from ultraviolet radiation
- Produces keratin, which protects against abrasion and repels water
- Synthesize vitamin D₃
- Store lipids in the dermis and in adipose tissue in the hypodermis
- Detect touch, pressure, and temperature stimuli
- Coordinate immune response to pathogens and skin cancers

The epidermis is composed of layers with various functions.

- Epidermis is dominated by keratinocytes
 - These cells form several layers or strata
- Deeper layers of the epidermis form epidermal ridges, adjacent to dermal papillae
 - **Dermal papillae** a nipple shaped mound creating ridges or dermal projections
 - Greatly increases the surface area for attachment, binding the epidermis to the dermis
