

6. Generator

OVERVIEW

These are belt-driven, 2-bearing, 2-pole (3600 rpm), revolving-field generators with brushes and slip rings (Figure 6-1). Output voltage is regulated by microcontroller-based genset controller A1 (Page 5-1).

Stator: The stator consists of steel laminations with two or three sets of windings in the lamination slots. The main windings (T1-T2, etc.) are for powering the connected loads. The quadrature windings (Q1-Q2) are for field excitation. Some models have battery charge windings (B1-B2).

Rotor: The rotor consists of a shaft with steel laminations wrapped with field windings. A molded slip ring assembly is pressed on to supply field current to

the rotor windings through the brush block assembly. The rotor shaft is supported on both ends by sealed ball bearings. The drive belt pulley and fans are center-bolted to the tapered rotor ends.

Brush Block: Field current passes through the brush block which has two spring-loaded carbon brushes that make contact with the rotor slip rings.

Principle of Operation: During startup genset controller A1 flashes the field with battery current for fast buildup of generator voltage as the engine accelerates to operating speed. During operation the controller maintains nominal AC output voltage by varying field current in response to load. In response to transient loads it lowers the voltage setpoint to allow for engine recovery.
