Induction Response Theory—The Basics

Introduction

Although patents for eddy current measurements in boreholes and in surface prospecting date from the early part of the century, the first practical technique of induction logging was introduced by H. G. Doll in 1949 (Doll, 1949, 1952). Doll derived the borehole logging tool from a jeep-mounted mine detector that he developed for the U.S. War Department during World War II. Induction measurements were originally intended as a substitute for laterolog tools in oil-base mud, where laterolog tools function poorly because they require direct contact with a conductive mud column in order to inject current into the formation. However, the induction tool has come to dominate the entire resistivity market because it makes an accurate measurement of formation resistivity over a wide range of drilling environments, including moderately conductive muds.
