

THE SKIN

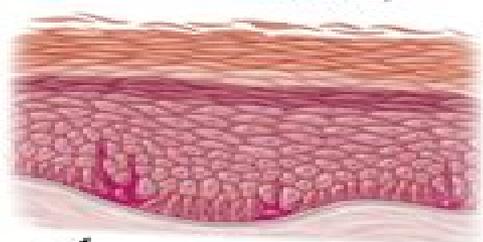

2ND EDITION

• The skin (or integument) is the largest organ in the body, and has many functions, including protection, sensation, thermoregulation, and some metabolic processes • Different areas of the body have different functional characteristics, such as thickness, color, and the presence of epidermal appendages (hair, glands, and nails)

• Skin is formed by two layers: the epidermis and the dermis

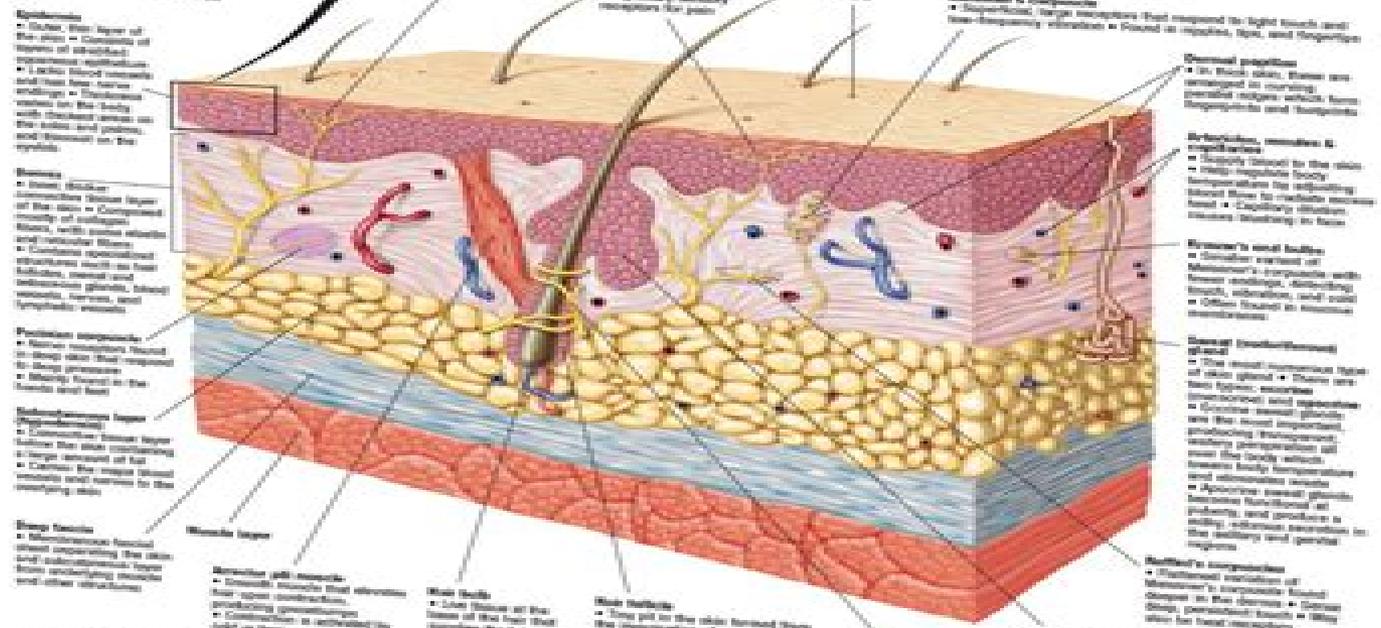

• Upper skin is classified as thin, but skin of the palms and soles of the feet is classified as thick • In thick skin, the epidermis is thickened, but not the dermis • Skin thickness ranges from 0.5 mm to over 5 mm

Figure 1: Layers of the Epidermis (Cross Section)

- Stratum corneum**
 - Outermost "thick layer" of thin squamous cells that are continuously shed and replaced on the surface • The cytoskeleton of these cells is replaced by keratinizing keratin • Functions as a barrier to water loss and bacteria from the environment
- Stratum lucidum**
 - "Clear layer" that is especially prominent in thick skin • Cell nuclei are generally absent, and the cells are flat with a soft gel like substance called elastin, which prevents excessive tearing
- Stratum granulosum**
 - "Granular layer" where keratinization begins • Cell nuclei are either absent or degenerate • This layer may be absent in thin skin
- Stratum spinosum**
 - "Spiny layer" where protein synthesis occurs for keratin production • This layer contains, primarily under a microscope
- Stratum basale**
 - Single "base layer" of cuboidal cells where mitosis occurs • Cells migrate from the upper layers and are eventually shed • Melanocytes, which are cells that produce the pigment melanin, are found in this layer • Difference in skin color are due to the amount of melanin produced, not the number of melanocytes
- Stratum germinativum**
 - "Growth layer" referring to the stratum spinosum and stratum basale together

Figure 2: Cross Section of Generic Skin Area

- Epidermis**
 - Outer, thin layer of the skin • Consists of layers of stratified squamous epithelium
 - Lacks blood vessels and has few nerve endings • Contains nuclei on the body with thickest areas on the palms and soles, and absent on the eyelids
- Dermis**
 - Thick, thicker connective tissue layer underneath the epidermis
 - Composed mostly of collagen fibers, with some elastic fibers and reticular fibers
 - Contains specialized structures such as hair follicles, sweat and sebaceous glands, blood vessels, nerves, and lymphatic vessels
- Papillary dermis**
 - Nerve receptors found in the epidermis that respond to deep pressure
 - Usually found in the hands and feet
- Subcutaneous layer (Hypodermis)**
 - Composed of a layer below the skin consisting of adipose tissue
 - Contains the major blood vessels and nerves to the underlying skin
- Deep fascia**
 - Membranous fascial sheet underlying the skin and subcutaneous layer from underlying muscles and other structures
- Stratum corneum**
 - Outermost layer of the epidermis
- Stratum lucidum**
 - Thin, clear layer between the stratum corneum and stratum granulosum
- Stratum granulosum**
 - Layer of the epidermis where keratinization begins
- Stratum spinosum**
 - Layer of the epidermis where protein synthesis occurs
- Stratum basale**
 - Single layer of cuboidal cells at the base of the epidermis
- Merkel's discs**
 - Superficial nerve endings that detect light touch
- Meissner's corpuscles**
 - Nerve fibers, ending in dermal papillae, that are the primary sensory receptors for pain
- Hair**
 - Epithelial appendage that extends from the epidermis
- Melanin's granules**
 - Pigment, large receptors that respond to light touch and low-frequency vibrations • Found in papillae, tips, and fingertips
- Dermal papillae**
 - In thick skin, these are arranged in curving parallel ridges which form fingerprints and footprints
- Sebaceous, sweat & mucous glands**
 - Supply blood to the skin • Help regulate body temperature by adjusting blood flow to radiate excess heat • Capillary dilation causes flushing in face
- Sweat's coil bulbs**
 - Coiled end of Meissner's corpuscles with loose endings, allowing touch, vibration, and cold • Often found in human membranes
- Sweat gland**
 - The most numerous type of skin gland • There are two types: eccrine (sweat) and apocrine (scent) glands
 - Eccrine sweat glands are the most important, producing thermoregulatory sweating that cools the body which lowers body temperature and stimulates appetite
 - Apocrine sweat glands become functional at puberty, and produce a sticky, odorous substance in the axillary and genital regions
- Merkel's corpuscles**
 - Flat-topped cells of Meissner's corpuscles found deep in the dermis • Detect deep pressure (touch) • They also act as touch receptors
- Sebaceous gland**
 - Secretes oil (sebum) to protect the hair and skin from water loss and fungal infection • Usually located along hair follicles • Sebaceous glands increase during puberty and may result in an accumulation of oil, clogging a pore, or pimple
