Multiphysics Modelling of Fluid-Particulate Systems Hassan Khawaja, Mojtaba Moatamedi, 2020-03-14 Multiphysics Modelling of Fluid Particulate Systems provides an explanation of how to model fluid particulate systems using Eulerian and Lagrangian methods The computational cost and relative merits of the different methods are compared with recommendations on where and how to apply them provided The science underlying the fluid particulate phenomena involves computational fluid dynamics for liquids and gases computational particle dynamics solids and mass and heat transfer In order to simulate these systems it is essential to model the interactions between phases and the fluids and particles themselves This book details instructions for several numerical methods of dealing with this complex problem This book is essential reading for researchers from all backgrounds interested in multiphase flows or fluid solid modeling as well as engineers working on related problems in chemical engineering food science process engineering geophysics or metallurgical processing Provides detailed coverage of Resolved and Unresolved Computational Fluid Dynamics Discrete Element Method CFD DEM Smoothed Particle Hydrodynamics and their various attributes Gives an excellent summary of a range of simulation techniques and provides numerical examples Starts with a broad introduction to fluid particulate systems to help readers from a range of disciplines grasp fundamental principles

Closed-Loop Systems for Next-Generation Neuroprostheses Timothée Levi, Paolo Bonifazi, Paolo Massobrio, Michela Chiappalone, 2018-04-26 Millions of people worldwide are affected by neurological disorders which disrupt the connections within the brain and between brain and body causing impairments of primary functions and paralysis Such a number is likely to increase in the next years and current assistive technology is yet limited A possible response to such disabilities offered by the neuroscience community is given by Brain Machine Interfaces BMIs and neuroprostheses The latter field of research is highly multidisciplinary since it involves very different and disperse scientific communities making it fundamental to create connections and to join research efforts Indeed the design and development of neuroprosthetic devices span involve different research topics such as interfacing of neural systems at different levels of architectural complexity from in vitro neuronal ensembles to human brain bio artificial interfaces for stimulation e g micro stimulation DBS Deep Brain Stimulation and recording e g EMG Electromyography EEG Electroencephalography LFP Local Field Potential innovative signal processing tools for coding and decoding of neural activity biomimetic artificial Spiking Neural Networks SNN and neural network modeling In order to develop functional communication with the nervous system and to create a new generation of neuroprostheses the study of closed loop systems is mandatory It has been widely recognized that closed loop neuroprosthetic systems achieve more favorable outcomes for users than equivalent open loop devices Improvements in task

performance usability and embodiment have all been reported in systems utilizing some form of feedback The bi directional communication between living neurons and artificial devices is the main final goal of those studies However closed loop systems are still uncommon in the literature mostly due to requirement of multidisciplinary effort Therefore through eBook on closed loop systems for next generation neuroprostheses we encourage an active discussion among neurobiologists electrophysiologists bioengineers computational neuroscientists and neuromorphic engineers This eBook aims to facilitate this process by ordering the 25 contributions of this research in which we highlighted in three different parts A Optimization of different blocks composing the closed loop system B Systems for neuromodulation based on DBS EMG and SNN and C Closed loop BMIs for rehabilitation

Force and Motion Jason Zimba,2009-06-01 Isaac Newton developed three laws of motion that govern the everyday world These laws are usually presented in purely mathematical forms but Jason Zimba breaks with tradition and treats them visually This unique approach allows students to appreciate the conceptual underpinnings of each law before moving on to qualitative descriptions of motion and finally to the equations and their solutions Zimba has organized the book into seventeen brief and well sequenced lessons which focus on simple manageable topics and delve into areas that often cause students to stumble Each lesson is followed by a set of original problems that have been student tested and refined over twenty years Zimba illustrates the laws with more than 350 diagrams an innovative presentation that offers a fresh way to teach the fundamentals in introductory physics mechanics and kinematics courses
