

Evolution & Natural Selection

DOODLE NOTES

GENETIC Evolution

natural selection changes the range of traits in a population - there are 3 ways it can change. Let's look at a multi population that shows

Evolution by natural selection

Describe the theory of natural selection and how the theory was first conceived (thought of).

An English naturalist named Charles Darwin went on a voyage around the world. He noticed that animals in similar environments had similar characteristics. For example, in the Galápagos islands, Darwin observed similar but non-identical species of finches on each island. He noticed that their beaks seemed to be adapted to their food source. After some time thinking and the work of other scientists, Darwin developed his theory of natural selection.

Individuals with favorable traits survive and reproduce, passing on those traits to their offspring. Over time, the population becomes better adapted to its environment.

An example of natural selection!

<p>A population of light brown mice lives on an island of dark rock. They have a thin tail.</p>	<p>COOL!</p> <p>A predator cat comes to hunt for the common variation.</p>
<p>Some mice have a thicker tail.</p>	<p>WOW!</p> <p>The light brown mouse are more likely to get caught - they are the best to eat!</p>
<p>The mice with thick tails are camouflage against the dark rock where they live.</p>	<p>NOOOOOO!</p> <p>The light brown mice are more likely to get caught - they are the best to eat!</p>
<p>A higher proportion of black mice are born in the next generation.</p>	<p>Over time, the population has changed as the mice with thick tails are the best to eat!</p>

Stabilizing selection

Stabilizing selection represents the graph - σ^2

GENE FLOW

What is it? Movement of genes in or out of a population happens through movement of individuals. This can bring new alleles into a population or change the frequency of existing alleles.

Example: A population of butterflies with a new allele introduced.
