

# Solutions to Part I of Game Theory

Thomas S. Ferguson

## Solutions to Section I.1

1. To make your opponent take the last chip, you must leave a pile of size 1. So 1 is a P-position, and then 2, 3, and 4 are N-positions. Then 5 is a P-position, etc. The P-positions are 1, 5, 9, 13, . . . , i.e. the numbers equal to 1 mod 4.

2.(a) The target positions are now 0, 7, 14, 21, etc.; i.e. anything divisible by 7.  
(b) With 31 chips, you should remove 3, leaving 28.

3.(a) The target sums are 3, 10, 17, 24, and 31. If you start by choosing 3 and your opponent chooses 4, and this repeats four times, then the sum is 28, but there are no 3's left. You must choose 1 or 2 and he can then make the sum 31 and so win.

(b) Start with 5. If your opponent chooses 5 to get in the target series, you choose 2, and repeat 2 every time he chooses 5. When the sum is 26, it is his turn and there are no 5's left, so you will win. But if he ever departs from the target series, you can enter the series and win.

4.(a) The P-positions are the even numbers,  $\{0, 2, 4, \dots\}$ .  
(b) The P-positions are  $\{0, 2, 4, 9, 11, 13, 18, 20, 22, \dots\}$ , the nonnegative integers equal to 0, 2, or 4 mod 9.  
(c) The P-positions are  $\{0, 3, 6, 9, \dots\}$ , the nonnegative integers divisible by 3.  
(d) In (a), 100 is a P-position. In (b), 100 is an N-position since  $100 = 1 \pmod 9$ . It can be put into a P-position by subtracting 1 (or 6). In (c), 100 is an N-position. It can be put into a P-position by subtracting 1 (or 4 or 16 or 64).

5. The P-positions are those  $(m, n)$  with both  $m$  and  $n$  odd integers. If  $m$  and  $n$  are both odd, then any move will require putting an odd number of chips in two boxes; one of the two boxes would contain an even number of chips. If one of  $m$  and  $n$  is even, then we can empty the other box and put an odd number of chips in each box.

6. (a) In solving such problems, it is advisable to start the investigation with simpler positions and work up to the more difficult ones. Here are the simplest P-positions.

The last position shows that chomping at  $(3,1)$  is a winning move for the first player.

(b) The proof uses an argument, called "strategy stealing" that is useful in other problems as well. Consider removing the upper right corner. If this is a winning move, we are done. If not, then the second player has a winning reply. But whatever that reply

Cooperative Games, Solutions and Applications Theo S. H. Driessen, 2013-03-09 The study of the theory of games was started in Von Neumann 1928 but the development of the theory of games was accelerated after the publication of the classical book Theory of games and economic behavior by Von Neumann and Morgenstern 1944 As an initial step the theory of games aims to put situations of conflict and cooperation into mathematical models In the second and final step the resulting models are analysed on the basis of equitable and mathematical reasonings The conflict and or cooperative situation in question is generally due to the interaction between two or more individuals players Their interaction may lead up to several potential payoffs over which each player has his own preferences Any player attempts to achieve his largest possible payoff but the other players may also exert their influence on the realization of some potential payoff As already mentioned the theory of games consists of two parts a modelling part and a solution part Concerning the modelling part the mathematical models of conflict and cooperative situations are described The description of the models includes the rules the strategy space of any player potential payoffs to the players the preferences of each player over the set of all potential payoffs etc According to the rules it is either permitted or forbidden that the players communicate with one another in order to make binding agreements regarding their mutual actions
