

# ABSTRACT

This experiment evaluates the effect of age and gender on the two photoreceptors in the human retina: rod cells which are responsible for peripheral vision and the detection of shapes and motion and three different types of cone cells responsible for the perception of colour. The research questions are: **Does the efficiency of the Rods and Cones decrease with Age? What is the efficiency of the L-cone versus the M-cone versus the S-cone? To what extent are the Rod cells more efficient than the three Cone cells? Does the efficiency of Rods and Cones differ between genders?**

In the experiment I used a vision disk which is a device to measure the angle of peripheral perception on the horizontal plane of the visual field. I conducted the experiment on a total of 75 people, divided into five different age groups, 32 of which were males and 43 were females. By using three different pointers with each one having a red/green/blue coloured dot on them, I was able to obtain values for colour sensitivity of the three different cones, as well as periphery values. By deriving average values for each age group, I was able to compare average rod and cone efficiency at different stages in life. Moreover, by subcategorizing the age groups into males vs. females, I could determine trends of photoreceptor efficiency according to gender.

I concluded that the efficiency of both photoreceptors decreases with age. In addition to that, the 'efficiency hierarchy' for cone cells is increasing from L-cone to S-cone to M-cone. The experiment showed that human rod cells are more efficient than cone cells. Lastly, the results indicated slightly that female photoreceptor efficiency is better than male photoreceptor efficiency. However, for this aspect no definite conclusions could be drawn due to insufficient data.
