

## Lab 6: Electric Circuits

### Essentials of Physics: PHYS 101

During the past 100 years we have come to rely on the movement of extremely small particles carrying charge — electrons — to do work for us in a variety of ways. For example, connecting a light bulb to a voltage source using wires allows that source to push electrons through the bulb's filament... and that skinny wire glows giving us light. Inside the filament electrons in motion are colliding with the atoms of the filament. The energy in motion of the electrons is transferred to the atoms, causing them to emit light.

Moving electrons also cause electric motors to turn, gasoline/air mixtures to ignite, phosphors to emit colored light, signals to be transmitted... etc. A single electron is extremely small (its mass is about  $1 / 10^{30}$  kg) and carries only  $2 / 10^{19}$  C charge, so we must rely on large numbers of moving electrons to do useful work for us. Imagine how expensive electricity would be if the power company charged us to supply and push each electron travelling into our home!

In this lab we will explore how batteries push on electrons and how the latter travel through simple circuits. There are two experiments to complete, below.

---

#### Experiment One: *What a pushy battery*

##### Part A: Introduction:

We saw in lecture that one could connect a battery to a light bulb using a simple circuit and bask in the glow of our efforts. What if we connected two batteries to the same light bulb as follows?
