**Machine Learning: A Probabilistic Perspective** Sweta, Dr. C. Ravi Shankar Reddy, Dr. Palak Keshwani, Sri. Shiva Shankar Reddy, 2023-03-21 Machine learning ML is a subfield of AI that allows computers to learn from the data and improve over time without being explicitly programmed Algorithms that use machine learning may analyze data for patterns and use that knowledge to generate predictions To sum up machine learning algorithms models acquire knowledge from previous data Traditional programming entails a computer engineer crafting a set of rules that tell a computer how to take raw data and produce a certain result Most commands follow an IF THEN format the computer acts only if the specified condition holds The opposite is true with machine learning which is the automated process that allows computers to solve issues with little or no human intervention and to respond following what they have learned from previous experiences The terms artificial intelligence machine learning are often used interchangeably although they refer to two distinct processes Machine learning is a branch of artificial intelligence that allows intelligent systems to autonomously learn new things from data while artificial intelligence as a whole refers to robots that can make choices acquire new skills and solve problems You may train machine learning algorithms to conduct computations process data and recognize patterns without explicitly programming them to do so by providing them with samples of labeled data

**Machine Learning** Sergios Theodoridis, 2020-02-19 Machine Learning A Bayesian and Optimization Perspective 2nd edition gives a unified perspective on machine learning by covering both pillars of supervised learning namely regression and classification The book starts with the basics including mean square least squares and maximum likelihood methods ridge regression Bayesian decision theory classification logistic regression and decision trees It then progresses to more recent techniques covering sparse modelling methods learning in reproducing kernel Hilbert spaces and support vector machines Bayesian inference with a focus on the EM algorithm and its approximate inference variational versions Monte Carlo methods probabilistic graphical models focusing on Bayesian networks hidden Markov models and particle filtering Dimensionality reduction and latent variables modelling are also considered in depth This palette of techniques concludes with an extended chapter on neural networks and deep learning architectures The book also covers the fundamentals of statistical parameter estimation Wiener and Kalman filtering convexity and convex optimization including a chapter on stochastic approximation and the gradient descent

family of algorithms presenting related online learning techniques as well as concepts and algorithmic versions for distributed optimization Focusing on the physical reasoning behind the mathematics without sacrificing rigor all the various methods and techniques are explained in depth supported by examples and problems giving an invaluable resource to the student and researcher for understanding and applying machine learning concepts Most of the chapters include typical case studies and computer exercises both in MATLAB and Python The chapters are written to be as self contained as possible making the text suitable for different courses pattern recognition statistical adaptive signal processing statistical Bayesian learning as well as courses on sparse modeling deep learning and probabilistic graphical models New to this edition Complete re write of the chapter on Neural Networks and Deep Learning to reflect the latest advances since the 1st edition The chapter starting from the basic perceptron and feed forward neural networks concepts now presents an in depth treatment of deep networks including recent optimization algorithms batch normalization regularization techniques such as the dropout method convolutional neural networks recurrent neural networks attention mechanisms adversarial examples and training capsule networks and generative architectures such as restricted Boltzman machines RBMs variational autoencoders and generative adversarial networks GANs Expanded treatment of Bayesian learning to include nonparametric Bayesian methods with a focus on the Chinese restaurant and the Indian buffet processes Presents the physical reasoning mathematical modeling and algorithmic implementation of each method Updates on the latest trends including sparsity convex analysis and optimization online distributed algorithms learning in RKH spaces Bayesian inference graphical and hidden Markov models particle filtering deep learning dictionary learning and latent variables modeling Provides case studies on a variety of topics including protein folding prediction optical character recognition text authorship identification fMRI data analysis change point detection hyperspectral image unmixing target localization and more

**Natural Language Processing of Semitic Languages** Imed Zitouni, 2014-04-22 Research in Natural Language Processing NLP has rapidly advanced in recent years resulting in exciting algorithms for sophisticated processing of text and speech in various languages Much of this work focuses on English in this book we address another group of interesting and challenging languages for NLP research the Semitic languages The Semitic group of languages includes Arabic 206 million native speakers Amharic 27 million Hebrew 7 million Tigrinya 6 7 million Syriac 1 million and Maltese 419 thousand Semitic languages exhibit unique morphological processes challenging syntactic constructions and various other phenomena that are less prevalent in other natural languages These challenges call for unique solutions many of which are described in this book The 13 chapters presented in this book bring together leading scientists from several universities and research institutes worldwide While this book devotes some attention to cutting edge algorithms and techniques its primary purpose is a thorough explication of best practices in the field Furthermore every chapter describes how the techniques discussed apply to Semitic languages The book covers both statistical approaches to NLP which are dominant across various applications

nowadays and the more traditional rule based approaches that were proven useful for several other application domains We hope that this book will provide a one stop shop for all the requisite background and practical advice when building NLP applications for Semitic languages
