

QUESTION 10000: The nurse is caring for a patient with a urinary tract infection (UTI). The patient reports a burning sensation when urinating. Which intervention is most appropriate for the nurse to implement?

Correct Answer:

Encourage the patient to drink plenty of fluids to help flush the urinary tract.

Rationale: Drinking plenty of fluids, such as water, helps dilute the urine and flush the urinary tract, which can help relieve the burning sensation associated with a UTI.

Incorrect Answers:

Administer pain medication as prescribed to relieve the burning sensation. (This is incorrect because pain medication does not directly address the underlying infection.)

Apply a warm compress to the lower back to provide relief. (This is incorrect because a warm compress is not a primary intervention for a UTI.)
