Applications of Arc Length and Sectors

A sector of a circle is a region of the circle bounded by a central angle and the intercepted arc.

A proportional relationship exists between the central angle bounding the sector and the complete circle. You have previously determined a fraction that could be used to find the arc length of a circular sector. If given a central angle value in degrees of rotation. This formula is then generalized for arc lengths of a circle of radius r in general terms.

$$\text{(Arc Length)} = \frac{n}{360^\circ}\text{(Circumference of Circle)}$$

Another way to look at arc length is to think about it in terms of a unit of measure. As you continue doing the given tasks in this assessment carefully, you should recognize that arc length is simply a portion of the circle's circumference and can be expressed in terms of π. This relationship can be summarized proportionally for a circle of any given radius r as follows.

$$\frac{\text{Arc Length}}{\text{Unit}} = \frac{\text{Degrees of Rotation}}{360^\circ}$$

Similarly, you also examined a fraction that could be used to find the area bound by a central angle on an angle of rotation of a circle of radius r.

$$\text{(Area Enclosed by Angle of Rotation)} = \frac{n}{360^\circ}\text{(Degrees of Rotation)}$$

As you continued tasks for your fulfillment of the previous activity, you discovered that the arc length, or area of a sector (or some measure) is proportional to the circle's area and could then be expressed in terms of π. This relationship is summarized proportionally for a circle of any given radius r as follows.

$$\frac{\text{Area Enclosed}}{\text{Unit}} = \frac{\text{Degrees of Rotation}}{360^\circ}$$
