Introduction

Traditional relative camera pose estimation relies on keypoint matches to generate camera pose hypotheses and then select the winning one. But, what happens when keypoint correspondences are not reliable?

Fundamental Scoring Network (FSNet)

FSNet is a correspondence-free method that predicts the pose error of query hypotheses. The predicted error is used to select the winning pose.

FSNet is supervised with a soft clamping of the ground truth error as well as the relative prediction, such as:

$$\mathcal{L} = |g(x) - p(x)| + |g(y) - p(y)|,$$

where $g(x)$ refers to the tanh(x/T) function, and T adjusts the threshold after which the accuracy of the angular error is not important.

Results (more in the paper!)

Fundamental matrix estimation accuracy (%) on ScanNet indoor dataset

Fundamental and Essential matrix estimation MAE and median errors:

| Method | Fundamental | | | Essential | | |
|---------------|-------------|-------|--------|-----------|-------|--------|
| | MAE | σ | Median | MAE | σ | Median |
| FSNet | 0.020 | 0.010 | 0.010 | 0.010 | 0.010 | 0.010 |
| Other Methods | 0.030 | 0.015 | 0.015 | 0.020 | 0.010 | 0.010 |

Motivation

Where do wrong solutions come from?

The most significant cause of wrong estimations is due to the scoring method not being able to select the correct hypothesis from the pool.

Why are wrong solutions selected?

There is a strong correlation between the number of correspondences and the accuracy of the selected relative pose estimation.

Embedding geometry through epipolar attention

Relative pose establishes point-to-line constraints. Epipolar attention allows a transformer to assess how well the point feature correlates with features along its corresponding epipolar line.

Epipolar lines for green point given two different relative pose hypotheses, where green point should correlate with the green line (correct hypothesis), while not with the red line (wrong hypothesis).

Conclusions

- FSNet performs exceptionally well in challenging scenarios with the or inaccurate correspondences.
- Limitation: If many correspondences, FSNet needs to be combined with other methods for best results. FSNet takes 0.8s to run 100 hypotheses.

Meeting the Challenges to Measurement in an Era of Accountability Henry Braun, 2016-01-29 Under pressure and support from the federal government states have increasingly turned to indicators based on student test scores to evaluate teachers and schools as well as students themselves The focus thus far has been on test scores in those subject areas where there is a sequence of consecutive tests such as in mathematics or English language arts with a focus on grades 4-8 Teachers in these subject areas however constitute less than thirty percent of the teacher workforce in a district Comparatively little has been written about the measurement of achievement in the other grades and subjects This volume seeks to remedy this imbalance by focusing on the assessment of student achievement in a broad range of grade levels and subject areas with particular attention to their use in the evaluation of teachers and schools in all It addresses traditional end of course tests as well as alternative measures such as portfolios exhibitions and student learning objectives In each case issues related to design and development psychometric considerations and validity challenges are covered from both a generic and a content specific perspective The NCME Applications of Educational Measurement and Assessment series includes edited volumes designed to inform research based applications of educational measurement and assessment Edited by leading experts these books are comprehensive and practical resources on the latest developments in the field The Open Access version of this book available at <http://www.taylorfrancis.com> has been made available under a Creative Commons Attribution Non Commercial No Derivatives 4.0 license
