

Activity 10

Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete each of the following questions, demonstrating your understanding of the concepts discussed in the lecture)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

E. A section of a chromosome is inserted

F. A piece of a chromosome is deleted

G. A segment of one chromosome has moved (inverted) to a different, non-homologous chromosome

H. A section of a chromosome appears to be on one chromosome but is really on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in 2ⁿ where n is total number chromosomes pairs, in this case with four chromosomes pairs we have 2⁴ which is 16 or 2x2x2x2 genetically different gametes

3. Although you will learn a classification of mutations that is useful, you recognize that some mutations cause the loss of function of a protein. For example, both color and eye color's ability to hear both are inherited together?

Both color and hearing together are found on the same chromosome. Therefore, they are inherited together as well, and a mutation of one only causes both, including non-mutated allele with it. So, color and hearing are inherited together.

4. Describe the alignment of chromosomes during prophase I, write symbols:

Chromosomes I homologous pairs and homologous chromosomes align together, called bivalents. This is a synaptonemal complex to allow the crossing over to occur and results in two types of gametes.

5. How does nondisjunction lead to chromosomal abnormalities? Describe two types of genetic disorders that can result from nondisjunction.
