sporadic way are emerging on the possible role of animals and some specific environmental hot spots ground water soil etc in which resistance can develop thanks to an efficient organization in clusters of genes that are then able to be selected and spread ultimately functioning as a reservoir for further transmission to humans Origin of resistance genes that we now know to belong to the so called mobilome and their mechanism of transferability among species and in different microbiota has to be considered a real challenge for the future evolution and antibiotic resistance in both pathogenic and opportunistic bacteria This Research Topic has the aim of collecting contributions from different experts in the antibiotic resistance field covering aspects of resistance in specific microorganisms and in diverse environments
