

Midterm Exam 2 Study Guide

Chapter 13 of 16 (13.1-13.11)

1) Diagrams and processes involved in DNA replication

- Process DNA processes = Chromosomes
- Replication starts the origin of chromosomal DNA (one short piece of DNA) (initiated within the origin)
 - Multiple origins to replicate
- All DNA replication from semi-conservative bidirectional replication
- All chromosomes undergo bidirectional replication and called replication
- E. Coli is single circular DNA's symmetrical copy of the DNA (DNA and single origin)

2) The sequence of the events of DNA replication

- 1) DNA-binding proteins bind the replication origin 2) The initiator bound to the surface of the proteinase and bind primer to DNA polymerase starting the DNA process 3) DNA synthesis starts at origins
- Fig 13.1
- Initiator: The beginning of the replication and synthesis of primer
- Elongation: Extension of the primer
- Completion: Finishing the replication of chromosome

3) DNA Replication and its relationship to cell division

- When the circular chromosome is fully replicated, the two new double-stranded copies remain together to constitute a Fig 13.16. An enzyme called DNA gyrase cuts one of the newly made DNA duplexes leading to separate the chromosomes. The two molecules will move to their respective daughter cells.
- In eukaryotic cells, the chromosomes are linear, and the architecture chromosome are called chromosomes. (Primary) replicated structures are formed consisting of about 100 molecules where the end primer is attached. DNA consists of a structure of chromosomes consisting of chromosomes.
