

Attachment of the crane base

The number of attachment bolts under the crane base depends on the attachment method and the maximum capacity of the crane. It should always be determined by and under the responsibility of the supplier of the crane. In any case, the part of the sub-frame on which the vehicle loading crane is to be mounted, must be attached to the chassis frame of the vehicle with large attachment plates and flange bolts.

Sub-frame dimensions

Always use a sub-frame when mounting a crane superstructure on a chassis frame. For the dimensions of the required sub-frame, refer to one of the two graphs shown below. The following information will help you to choose the applicable graph:

The 2 graphs (A and B) can be used to determine the sub-frame dimensions as follows. Graph A: from a crane capacity of, for instance, 140 kNm, draw an imaginary horizontal line to the right until it crosses the vertical line of the side member, for instance 260x75x6 (LF55). The reading for the sub-frame dimensions is box section 160x60x6. The dimensions of the chassis members (possibly with flitches) in the indicated critical zones (*) see figure) of the chassis can now be read from the bodybuilders' drawings.

These drawings are available from DAF and they can be found as digital files on the TOPEC CD-ROM and the internet (www.daf.com).

Graph B: Crane at rear end of chassis
Sub-frame material Fe 510 D, according to EN 10025 (St 52-3 according to DIN 17100).

Torsional stability

If a vehicle loading crane is fitted at the rear end of the chassis, a torsional stiffener must be provided in the rear overhang. The torsional stiffening may be provided by the superstructure itself or by a sub-frame stiffener; also see "Torsional stability of the sub-frame" in section 3.1: "Superstructure with sub-frame". The stability is determined by the vehicle, the load, the
