Pathology of Sharp Force Trauma Peter Vanezis, 2021-07-11

Pathology of Sharp Force Trauma illustrates and details sharp force trauma as seen in forensic pathology case work as well as in the clinical setting, outlining how one informs the other in interpreting such trauma for medico-legal purposes. For the purposes of discussion, the author defines sharp force trauma as the application of force to produce an injury which results in a clear division or separation of the skin and underlying tissues. Sharp force trauma may be caused by all manner of implements with a sharp edge and/or pointed end, whether or not they have been produced for use as a weapon and includes knives, broken glass, scissors and many others to name but a few. Certain tools such as axes or machetes combine a sharp edge with heavy weight and produce injuries with both sharp and blunt impact elements. In many countries, with the exception of those where firearms are readily available, sharp force trauma, particularly the use of knives, is the most common method of homicide and a frequent source of morbidity seen in emergency departments. Also, there has recently been an alarming upsurge in the use of knives in gang-related assaults and in terrorist incidents. As such, the book takes a comprehensive approach in explaining the different aspects of such trauma, most importantly the manner in which the victim has died. This includes cases of homicide, suicide or accident, indicating the type of weapon responsible, explaining how it was used and presenting other such information to the investigation of such cases.
