

# Evidence of Evolution

## Background

When Charles Darwin first proposed the idea that all new species descend from an ancestor, he performed an exhaustive amount of research to provide as much evidence as possible. Today, the major pieces of evidence for this theory can be broken down into the fossil record, embryology, comparative anatomy, and molecular biology.

## Fossils

This is a series of skulls and front leg fossils of organisms believed to be ancestors of the modern-day horse.

*The Evolution and Fossil Record of Parasitism* Kenneth De Baets,John Warren Huntley,2022-01-01 This two volume edited book highlights and reviews the potential of the fossil record to calibrate the origin and evolution of parasitism and the techniques to understand the development of parasite host associations and their relationships with environmental

and ecological changes The book deploys a broad and comprehensive approach aimed at understanding the origins and developments of various parasite groups in order to provide a wider evolutionary picture of parasitism as part of biodiversity This is in contrast to most contributions by parasitologists in the literature that focus on circular lines of evidence such as extrapolating from current host associations or distributions to estimate constraints on the timing of the origin and evolution of various parasite groups This approach is narrow and fails to provide the wider evolutionary picture of parasitism on and as part of biodiversity Volume two focuses on the importance of direct host associations and host responses such as pathologies in the geological record to constrain the role of antagonistic interactions in driving the diversification and extinction of parasite host relationships and disease To better understand the impact on host populations emphasis is given to arthropods colonial metazoans echinoderms mollusks and vertebrates as hosts In addition novel techniques used to constrain interactions in deep time are discussed ranging from chemical and microscopic investigations of host remains such as blood and coprolites to the statistical inference of lateral transfer of transposons and host parasite coevolutionary dynamics using molecular divergence time estimation
