Review Questions

1. Answer: 3
Rationale: Although the female growth spurt begins earlier than the male's, it also ends sooner (3), limiting the girl's mature height. Testosterone (1) is the primary male hormone. Girls begin puberty earlier (2), but they end it sooner than boys. Onset of puberty initiates the growth spurt rather than stopping it (4). Estrogen and progesterone, which increase as the girl matures, eventually stop her growth in height.
2. Answer: 2
Rationale: Although most sperm are released in semen with ejaculation, some semen is often secreted before ejaculation and can fertilize a waiting ovum (2). Although ejaculation can occur at any time, the penis becomes flaccid after ejaculation, preventing penetration (1). Sperm are added to the seminal fluid by contractions of the vas deferens before ejaculation (3). Semen typically enters the urethra shortly before ejaculation (4).
3. Answer: 3
Rationale: The endometrium (3) is the inner mucosal layer that responds to cyclic hormonal changes during the menstrual cycle and also receives the fertilized ovum when it implants. The parametrium (1) is the outer serosal layer and the myometrium (2) is the middle muscular layer.
