**Basic and applied research on deception and its detection** Wolfgang Ambach, Matthias Gamer, 2014-08-07 Deception is a ubiquitous phenomenon in social interactions and has attracted a significant amount of research during the last decades The majority of studies in this field focused on how deception modulates behavioral, autonomic and brain responses and whether these changes can be used to validly identify lies Especially the latter question which historically gave rise to the development of psychophysiological lie detection techniques has been driving research on deception and its detection until today The detection of deception and concealed information in forensic examinations currently constitutes one of the most frequent applications of psychophysiological methods in the field With the increasing use of such methods the techniques for detecting deception have been controversially discussed in the scientific community It has been proposed to shift from the original idea of detecting deception per se to a more indirect approach that allows for determining whether a suspect has specific knowledge of crime related details This so called Concealed Information Test is strongly linked to basic psychological concepts concerning memory, attention, orienting and response monitoring Although research in this field has intensified with the advancement of neuroimaging techniques such as PET and fMRI in the last decade basic questions on the psychological mechanisms underlying modulatory effects of deception and information concealment on behavioral, autonomic and brain responses are still poorly understood This Research Topic brings together contributions from researchers in experimental psychology, psychophysiology and neuroscience focusing on the understanding of the broad concept of deception including the detection of concealed information with respect to basic research questions as well as applied issues This Research Topic is mainly composed of original research articles but reviews and papers elaborating on novel methodological approaches have also been included Experimental methods include but are not limited to behavioral, autonomic, electroencephalographic or brain imaging techniques that allow for revealing relevant facets of deception on a multimodal level While this Research Topic primarily includes laboratory work relevant issues for the field use of such methods are also discussed

**The Influence of Internal Barriers on Open Innovation** Pedro de Faria, Florian Noseleit, Bart Los, 2021-03-22 Despite providing us with a good understanding of how firms use certain mechanisms to benefit from open innovation strategies current research provides only limited insights into how barriers internal to the firm may hamper knowledge transfer and limit effective utilization of external knowledge sources The Influence of Internal Barriers on Open Innovation proposes a dynamic

perspective that addresses this gap and aims at stimulating this discussion in two ways First by looking at how the way firms structure their internal innovation activities may unintentionally create barriers to the incorporation of external knowledge Second by reflecting on how internal barriers might be coupled to firm decisions aimed at the optimization of innovation processes like the balance between exploration and exploitation strategies The chapters of this book provide detailed conceptualization and investigation of organizational characteristics and practices that influence internal barriers to open innovation The diverse set of studies described in the chapters of this book will help open innovation scholars to better understand the challenges that firms face when dealing with internal barriers that affect their external knowledge search and knowledge sourcing The chapters in this book were originally published as a special issue of the journal Industry and Innovation
