## **Microbial Strategies For Crop Improvement:**

**Microbial Strategies for Crop Improvement** Mohammad Saghir Khan, Almas Zaidi, Javed Musarrat, 2009-08-25 With an ever increasing human population the demand placed upon the agriculture sector to supply more food is one of the greatest challenges for the agrarian community In order to meet this challenge environmentally unfriendly agrochemicals have played a key role in the green revolution and are even today commonly recommended to circumvent nutrient deficiencies of the soils The use of agrochemicals is though a major factor for improvement of plant production it causes a profound deteriorating effect on soil health soil fertility and in turn negatively affects the productivity and sustainability of crops Concern over disturbance to the microbial diversity and consequently soil fertility as these microbes are involved in biogeochemical processes as well as economic constraints have prompted fundamental and applied research to look for new agro biotechnologies that can ensure competitive yields by providing sufficiently not only essential nutrients to the plants but also help to protect the health of soils by mitigating the toxic effects of certain pollutants In this regard the role of naturally abundant yet functionally fully unexplored microorganisms such as biofertilizers assume a special significance in the context of supplementing plant nutrients cost and environmental impact under both conventional practices and derelict environments Therefore current developments in sustainability involve a rational exploitation of soil microbial communities and the use of inexpensive though less bioavailable sources of plant nutrients which may be made available to plants by microbially mediated processes
