With their unprecedented success cancer immunotherapies including immune checkpoint inhibitors ICIs cancer vaccines adoptive cell therapy ATC and immunomodulators are being increasingly used for various malignancies Distinct from traditional treatments including surgery radiation therapy and chemotherapy immunotherapeutics attempt to create long lasting anti tumor effects However only a minority of patients experience long term benefits to single agent immunotherapy and most patients do not have initial responses to the immunotherapy or develop relapse after promising initial responses Strategies to overcome immunotherapy resistance include 1 the development of biomarkers to select potential responders and or exclude potential non responders and 2 the usage of combination treatments ICIs radiotherapy chemotherapy vaccines fecal microbiota transplantation FMT and etc comprising different mechanisms of action and target multiple resistant mechanisms At the same time the possibility of new side effects due to the combinatorial strategies or the potential amplification of the well known side effects of the ICIs termed immune related adverse events irAEs should be carefully monitored

*Evolutionary Biology of Tumor Initiation and Progression* Yusuke Suenaga,Erich Bornberg-Bauer ,Mamoru Kato,2024-06-28 Cancer is characterized by heterogeneous cells with capacity for self renewal and selective pressures in the microenvironment which constantly change the cell population This descent with modification is consistent with Darwin s definition of evolution and accordingly cancer progression can be captured from an evolutionary angle However there is also a clear difference between cancer progression and biological evolution First contrary to the evolution of complex organisms cancer originates from cells of multicellular organisms that escape their constraints and behave like unicellular organisms Therefore from the beginning cancer cells have complex genomes that contain abundant genetic materials which they can use to change their phenotype by dynamic rearrangements and modifications Secondly epigenetic effects promote cancer evolution in contrast to the evolution of life Some tumors develop with minimal genetic alterations and cell plasticity contributes to both initiation and progression in various tumors However an evolutionary theory that encompasses these characteristics of cancer remains to be developed
