Definition

An angle that measures exactly 90 degrees.
An angle that is larger than 90 degrees, yet less than 180 degrees.
An angle that measures less than 90 degrees.
An angle that measures exactly 180 degrees.
Any enclosed figure that is bounded by straight line segments.
Any three-sided polygon.
Any four-sided polygon such as a square, rectangle, trapezoid, etc.
Any five-sided polygon.
Any six-sided polygon.
Any eight-sided polygon.
Any n-sided polygon.
A polygon that has the same length sides and equal angles. An example of this would be a square.
Two lines that will never cross.
Two figures that are the same size and shape.
The total degree measurement of all angles of any triangle.
The total degree measurement of all angles of any four-sided polygon.
To make as many triangles out of a polygon.

Be able to:

- Determine the missing angle of a triangle when given two of the angles. An example of this would be if two angles of a triangle measured 22 and 50 degrees, what would the third angle measure? To answer this, you must understand that the sum of three angles of a triangle (or more what ever an shape) equals 180 degrees. So to answer the question, add 22 degrees + 50 degrees = 72 degrees. Then take 180 degrees and subtract 72 degrees to get the answer of the third angle, which would be 108 degrees.
- Be able to do the same with a quadrilateral as you did with the triangle.
- Be able to triangulate a polygon. An example of this would be 
- Be able to determine the total amount of degrees of a polygon after triangulating it. Example is the previous polygon, would be 2 triangles since 180 degrees equals 360 degrees.
- Be able to draw rectangle ABCD. Make side AB = 2 cm, Make side BC = 4 cm. Remember to label your polygon. Do you think anyone will draw the same rectangle? Why or why not?
- Be able to measure and draw angles.
- We will also review adding and subtracting fractions such as $\frac{1}{2} + \frac{1}{3}$
