Eye Gaze Interaction for a Mobile Text Application. A New Interface Concept Thomas Mayer, 2019-10-18 Bachelor Thesis from the year 2019 in the subject Computer Science Applied grade 1 0 LMU Munich language English abstract A common element of a user interface for initiating an action is the button that is traditionally touched or clicked A new concept is introduced in this work that extends the standard functionality of a button with advanced gaze based functions the GazeButton It acts as an universal interface for gaze based UI interactions during a classic touch interaction It is easy to join with existing UIs and unobtrusively complementary because it keeps the users freedom to choose between classic and gaze

based interaction In addition it is uncomplicated because all new functions are locally bound to it and despite being just a small UI Element it is usable for interactions throughout the display and even beyond because of its gaze component The GazeButton is demonstrated using a text editing application on a multitouch tablet computer For example a word can be selected by looking at it and tapping the GazeButton avoiding strenuous physical movement For such examples concrete systematic designs are presented that combine visual and manual user input whereafter the gaze based text selection is compared with the classic touch based one in a user study

Eye Tracking Methodology: Theory and Practice Andrew Duchowski, 2013-03-14. The scope of the book falls within a fairly narrow Human-Computer Interaction domain, i.e. describing a particular input modality; however, it spans a broad range of interdisciplinary research and application topics. There are at least three domains that stand to benefit from eye-tracking research: visual perception, human-computer interaction, and computer graphics. The amalgamation of these topics forms a symbiotic relationship. Graphical techniques provide a means of generating rich sets of visual stimuli ranging from 2D imagery to 3D immersive virtual worlds, while research exploring visual attention and perception in turn influences the generation of artificial scenes and worlds. Applications derived from these disciplines create a powerful Human-Computer Interaction modality, namely interaction based on knowledge of the user's gaze. Recent advancements in eye-tracking technology, specifically the availability of cheaper, faster, more accurate, and easier-to-use trackers, have inspired increased eye movement and eye-tracking research efforts. However, although eye trackers offer a uniquely objective view of overt human visual and attentional processes, eye trackers have not yet gained widespread use beyond work conducted at various research laboratories. This lack of acceptance is due in part to two reasons: first, the use of an eye tracker in an applied experimental setting is not a widely taught subject; hence, there is a need for a book that may help in providing training. *CHI 99 Conference Proceedings*, Marian G.
