Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete your work on the following questions, understanding your understanding of the concepts discussed in the lesson)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

a. a section of a chromosome is inserted

b. a piece of a chromosome is deleted

c. a large section of a chromosome has moved (inverted) to a different part of the chromosome

d. a section of a chromosome appears to be on one chromosome but is actually on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in a diploid cell there are four chromosome pairs. Each pair can contribute either one or two chromosomes to the gametes.

3. Although you will learn a mechanism of mutation that causes gene mutations, you may notice that some mutations cause the loss of function of a protein. For example, both colour and eye colour mutations may cause this loss of function together?

Yes, because a mutation together can cause a loss of function. For example, a mutation in the gene for eye colour can cause a loss of function, and a mutation in the gene for eye colour can cause a loss of function. A mutation in the gene for eye colour can cause a loss of function together.

4. Describe the alignment of chromosomes during prophase I, write the equations:

Chromosomes I and II are aligned and chromosomes III and IV are aligned. This is a diploid cell because it has two sets of chromosomes, one set from each parent.

5. How does recombination lead to chromosomes with different numbers? Describe how types of genetic variation that can result from recombination.
